ONSITE DEMO/TRIAL PROGRAM

It's Critical to Use the Right Equipment for Each Application

Using the right equipment for each step of any spray finishing process is typically the difference between hitting quality, productivity and

profitability targets – and not hitting them. Additionally, the ever increasing diversity of finishes dictates careful selection and proper use of equipment.

With nearly 220 years of collective leadership in the spray finishing industry, Binks and DeVilbiss continue to set the equipment standards other brands strive to achieve. Regardless of wood type, new and varied coating materials, or other special requirements, Binks and DeVilbiss are dedicated to supporting you with a team of experts – Wood Specialists, Equipment Design Engineers, Technicians, Trainers and Customer Service Professionals.

We're here to help you improve every aspect of your spray finishing operation – Higher Quality, Increased Productivity, New Cost-Efficiencies, Reduced Downtime, Environmental Compliances... and Improved Bottom-Line Results.

Spray Application Processes

Atomization Technology Options

Conventional, HVLP, LVMP (Trans-Tech), Air Assist Airless and Airless are all types of Atomization technology, each has slightly different operating parameters.

Conventional Air Atomizing

The most established method of air atomizing, used on spray guns for decades. It uses high velocity air jets to produce a very high atomization power. However; this speed results in low transfer efficiency due to considerable “bounce-back” and overspray. Air pressure exiting the air cap during use is typically 30 to 60 psi (2 to 4 bar) with typical air consumption of 6 to 25 cfm (170 to 700 l/min).

High Volume Low Pressure (HVLP)

Although not new, this method first became important in the early 1990s when environmental legislation started to be introduced. It uses larger air volumes (11 to 30 cfm or 300 to 840 l/min) at low pressure to atomize the coating. HVLP has a much higher transfer efficiency than conventional air atomizing due to the lower air pressures. The droplet sizes produced tend to be slightly larger, sometimes resulting in a lower quality finish. Officially HVLP is limited by Government Environmental Legislation to a maximum of 10 psi (0.7 bar) atomizing pressure measured at the air cap.

Trans-Tech (LVMP)

This equipment type was first seen in the mid 1990s and is a mixture of Conventional and HVLP atomization methods. Trans-Tech makes more energy available for the atomization process but gives a higher transfer efficiency of coating material than the Conventional air atomizing method. To qualify as Trans-Tech the air cap must be able to transfer at least 65% of the sprayed material to the sprayed component (BSEN 13966 Determination of Transfer Efficiency of atomizing and spraying equipment for liquid coating materials). Air cap pressure is typically in the region of 20 to 45 psi (1.3 psi to 3 bar) while using 9 to 20 cfm (250 to 560 l/min) to carry out its work.

Air Assist Airless

To maximize efficiency, the best features of air spray and airless atomization are combined. This process is called Air Assist Airless. The pattern is formed by the spray tip and air is used to eliminate tails and adjust the shape. Air Assist Airless provides fast application of materials, a soft spray that reduces fog, and the ability to penetrate into recesses and cavities. This is especially important in the wood industry where intricate shapes require a fine finish.

Airless

Fluid is atomized by high pressure usually 500 to 4500 PSI and pushed through an orifice in the spray nozzle. The shape of the fluid orifice determines the fan pattern. The particle size is larger than other spray methods so it is not generally used for fine finishes.

Advantages: Airless spray has a high transfer efficiency, allows for high speed production, and provides less overspray.

Fluid Delivery Options

Siphon-Feed

Siphon-feed hookups (external atomization) use vacuum created at the nozzle to draw fluid from a cup.

Advantages: This fluid cup system offers quick material / color changes.

Pressure-Feed

This option uses an external pressure source (pressure tank, piston pump, or diaphragm pump) to force air and fluid to the spray gun nozzle. Air and fluid are then mixed outside the nozzle (external mix air caps).

Advantages: This method delivers higher volumes of fluids than other gun set ups, and will spray a wider range of materials. It also enables independent control of fluid pressures.

Gravity-Feed

On Gravity-feed guns the cup is located above the gun. The force of gravity pushes the fluid into the gun.

Advantages: This method offers quick color changes and convenience on small jobs or touch-up applications. Gravity guns are able to use all of the coating – reducing waste.

Superior Stain Solutions

Consistently achieving the desired colors from varied types of wood is no small accomplishment. It requires knowledge, skill and the best equipment available.

Stain is used to establish the undertone color of nearly every piece of professionally finished wood product – and therefore making the staining process

the single most critical process for achieving uniform overall finish.

The Binks and DeVilbiss spray guns below have been painstakingly selected as your very best equipment available for achieving optimum results in all your spray staining applications.

To consult with one of our Wood Finishing Specialists, or a Wood Finishing Distributor in your area, call us at the toll-free number on the back of this brochure – or visit our web site:

Stain Finishing Outfits

The equipment packages shown on this page have been carefully selected to help wood finishing professionals consistently achieve optimum stain application results.

A considerable amount of time and resources have been invested in selecting and assembling these packages – for maximum up-time and minimum maintenance with Binks and DeVilbiss products.

Your local wood finishing materials source will assist you with additional information about specific finishing applications. Contact your paint / equipment sales or customer service representative for assistance.

Conventional Outfits*

*All 2-qt. Outfits include 6-ft. Hoses. All Tank & Pump Outfits include 25-ft. hoses.

Binks

Smart Sealer Strategies

Sealers are used for sealing off areas on pieces of wood that are prone to soak up too much stain (like end grain). Failure to apply sealer at appropriate areas of pieces being sprayed can cause dark spots on the finished product.

Not all spray equipment is suitable for cost-efficient and top quality wood finishing. However, after decades of R&D, endless testing and engineering advancements, Binks and DeVilbiss guns and accessories clearly set the industry standards for excellence.

The equipment listed on this page has been designed, manufactured and field-tested to produce the highest quality finishes utilizing sealer applications. For Technical Support, call us toll-free at 888-992-4657.

Total Top-Coat Tactics

Quite simply, top-coats provide build and protection. It's at this final stage of the spray finishing process that each finished piece is either beautifully and professionally finished, or set aside for a

re-work (because the top-coat quality level was not achieved).

The Binks and DeVilbiss spray guns on this page are proven performers in woodworking industries requiring high

quality top-coats. There is a top performing spray gun for every type of operation - regardless of your productivity or volume needs.

Top-Coat Outfits

Because top-coats are typically the last step in most wood shop finishing processes, they are also typically the most visible aspect of finished products.

The equipment packages below have been carefully field-tested and selected for their ability to consistently deliver top-coats you'll be proud of.

There is a top-coat spray finishing package below to meet your every production requirement and volume application.

Wood Finishing Accessories

The world's best spray finishing professionals can't perform at their maximum potential without properly using the best auxiliary equipment components.

That's why we offer a full complement of accessories you can count on every day. Cups for lower volume tasks. Tanks for larger volume projects. All the right capacities. All the right technologies. All the right features.

We also offer classes, workshops, and seminars to help you hit your quality and productivity targets. We offer everything you need to maximize your spray finishing performance.

Gravity-Feed & Siphon-Feed Cups
